

## **Ganz Semi-Flexible Solar Panels & How They Survived a 50 Caliber Bullet**

**Ganz = Durability**

**Ganz Semi-Flexible Solar Panels** extreme durability has been proven by their ability to withstand extreme winds and salt water...and now bullets from a 50 caliber machine gun can be added to that list!

At a U.S Military Training Base, **Ganz Solar Panels** are replacing the “glass panels” because they simply cannot survive the impacts. The solar panels are being used to charge the batteries that power pop-up moving targets at a firearms training range. They are installed beneath a moving target and the exercise involves shooting at the target with 50 caliber machine guns.

The military base made this switch because unlike the **Ganz Semi-Flexible Solar Panels**, the glass panels cannot survive the 50+mph winds along with dust and rock pelting. Glass panels also cannot withstand the stray bullets that hit the panels. A spokesperson from the military base confirms: **“The performance of the Ganz Solar Panels is excellent!”** and **“We no longer have to worry about broken glass”**.

### **They made the switch from Glass to Ganz!**
